The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.

About Microsemi

Microsemi, a wholly owned subsidiary of Microchip Technology Inc. (Nasdaq: MCHP), offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. 1 Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the current publication.

1.1 Revision 4.0

The following is a summary of the changes made in revision 4.0 of this document.

- Replaced [Figure 2](#), [page 2](#), [Figure 3](#), [page 3](#), [Figure 8](#), [page 6](#), and [Figure 9](#), [page 7](#).
- Removed section [Transmit PLL](#), [page 4](#).
- Updated [Table 1](#), [page 3](#), [Table 3](#), [page 7](#), [Table 4](#), [page 7](#), and [Table 5](#), [page 8](#).
- Updated section [PLL for Pixel Clock Generation](#), [page 4](#).
- Updated section [Configuration Parameters](#), [page 7](#).

1.2 Revision 3.0

The following is a summary of the changes made in revision 3.0 of this document.

- [SLVS-EC IP](#), [page 2](#)
- [Table 3](#) on [page 7](#)

1.3 Revision 2.0

The following is a summary of the changes made in revision 2.0 of this document.

- [SLVS-EC IP](#), [page 2](#)
- [Transceiver Configuration](#), [page 3](#)
- [Table 3](#) on [page 7](#)

1.4 Revision 1.0

Revision 1.0 was the first publication of this document.

2 SLVS-EC IP

SLVS-EC is Sony's high-speed interface for next-generation high-resolution CMOS image sensors. This standard is tolerant of lane-to-lane skew because of embedded clock technology. It makes a board-level design easy in terms of high-speed and long-distance transmission.

SLVS-EC Rx IP core provides SLVS-EC interface for PolarFire FPGA to receive image sensor data. The IP supports speed up to 4.752 Gbps. The IP core supports two, four, and eight lanes for RAW 8, RAW 10, and RAW 12 configurations.

The following figure shows the system diagram for the SLVS-EC camera solution.

Figure 1 • SLVS-EC IP Block Diagram

PolarFire[®] transceiver is used as the PHY interface for the SLVS-EC sensor since the SLVS-EC interface uses embedded clock technology. It also uses 8b10b encoding, which can be recovered using the PolarFire transceiver. PolarFire FPGA has up to 24 low-power 12.7 Gbps transceiver lanes. These transceiver lanes can be configured as the SLVS-EC PHY receiver lanes. As shown in the preceding figure, the transceiver outputs are connected to SLVS-EC Rx IP core.

2.1 SLVS-EC Receiver Solution

The following figure shows the Libero SoC software top level design implementation of SLVS-EC IP and the required components for the SLVS-EC receiver solution.

Figure 2 • SLVS-EC IP SmartDesign

2.2 Transceiver Configuration

The following figure shows the transceiver interface configuration.

Figure 3 • Transceiver Interface Configurator

The Transceiver can be configured to either two or four lanes. Also, the speed of the transceiver can be set at the “Transceiver data rate”. SLVS-EC interface supports two baud rates as listed in following table.

Table 1 • SLVS-EC Baud Rate

Baud Grade	Baud Rate in Mbps
1	1188
2	2376
3	4752

Set the reference clock frequency as per the clock source connected to the transceiver.

2.2.1 PLL for Pixel Clock Generation

A PLL is required to generate pixel clock from the Transceiver generated Fabric clock that is, LANE0_RX_CLOCK. Following is the formula to generate pixel clock.

$$\text{Pixel clock} = (\text{LANE0_RX_CLOCK} * 8) / \text{DATA_WIDTH}$$

Configure the PF_CCC for RAW 8 as shown in the following figure.

Figure 4 • Clock Conditioning Circuitry

2.3 Design Description

The following figure shows the SLVS-EC Frame Format structure.

Figure 5 • SLVS-EC Frame Format Structure

The Packet header contains information about the frame start and end signals along with the Valid lines. PHY control codes are added above the packet header to form the SLVS-EC packet. The following table lists the different PHY control codes used in the SLVS-EC protocol.

Table 2 • PHY Control Code

PHY Control Code	8b10b Symbol Combination
Start Code	K.28.5 - K.27.7 - K.28.2 - K.27.7
End Code	K.28.5 - K.29.7 - K.30.7 - K.29.7
Pad Code	K.23.7 - K.28.4 - K.28.6 - K.28.3
Sync Code	K.28.5 - D.10.5 - D.10.5 - D.10.5
Idle Code	D.00.0 - D.00.0 - D.00.0 - D.00.0

2.3.1 SLVS-EC RX IP Core

This section describes the hardware implementation details of SLVS-EC Receiver IP. The following figure shows the Sony SLVS-EC receiver solution that contains the PolarFire SLVS-EC RX IP. This IP is used in conjunction with the PolarFire transceiver interface block. The following figure shows the internal blocks of the SLVS-EC Rx IP.

Figure 6 • Internal Blocks of the SLVS-EC RX IP

2.3.1.1 aligner

This module receives the data from the PolarFire transceiver blocks and aligns to the sync code. This module looks for the sync code in the bytes received from the transceiver and locks to the byte boundary.

2.3.1.1.1 slvsec_phy_rx

This module receives the data from the aligner and decodes the incoming SLVS PHY packets. This module passes through the synchronization sequence and then, generates the `pkt_en` signal starting from Start code and ends at the end code. It also removes the PAD code from the data packets and sends the data to the next module that is `slvsrx_decoder`.

2.3.1.1.2 slvsrx_decoder

This module receives the data from the `slvsec_phy_rx` module and extracts the pixel data from the payload. This module extracts four pixels per clock per lane and sends to the output. It generates the line valid signal for the active lines validating the active video data. It also generates the Frame valid signal by looking at the frame start and frame end bits in the packet header of the SLVS-EC packets.

2.3.2 FSM with Data Decoding States

The following figure shows the FSM for SLVS-EC RX IP.

Figure 7 • FSM for SLVS-EC RX IP

2.3.2.1 SLVS-EC Receiver IP Configuration

The following figure shows the SLVS-EC receiver IP configurator.

Figure 8 • SLVS-EC Receiver IP Configurator

2.3.3 Configuration Parameters

The following table lists the description of the configuration parameters used in the hardware implementation of SLVS-EC receiver IP block. These are generic parameters and can vary based on the application requirements.

Table 3 • Configuration Parameters

Name	Description
DATA_WIDTH	Input pixel data width. Supports RAW 8, RAW 10, and RAW 12.
LANE_WIDTH	Number of SLVS-EC lanes. Supports two, four, and eight lanes.
BUFF_DEPTH	Depth of the buffer. Number of active pixels in active video line.

Buffer depth can be calculated by using the following equation:

$$\text{BUFF_DEPTH} = \text{Ceil} ((\text{Horizontal Resolution} * \text{RAW width}) / (32 * \text{Lane width}))$$

Example: RAW width = 8, Lane width = 4, and Horizontal Resolution = 1920 pixels

$$\text{BUFF_DEPTH} = \text{Ceil} ((1920 * 8) / (32 * 4)) = 120$$

2.3.4 Inputs and Outputs

The following table lists the input and output ports of the SLVS-EC RX IP configuration parameters.

Table 4 • Input and Output Ports

Signal Name	Direction	Width	Description
LANE#_RX_CLK	Input	1	Recovered clock from the transceiver for that particular Lane
LANE#_RX_READY	Input	1	Data ready signal for Lane
LANE#_RX_VALID	Input	1	Data Valid signal for Lane
LANE#_RX_DATA	Input	32	Lane recovered data from transceiver
LINE_VALID_O	Output	1	Data valid signal for active pixels in a line
FRAME_VALID_O	Output	1	Valid signal for Active lines in a frame
DATA_OUT_O	Output	DATA_WIDTH*LANE_WIDTH*4	Pixel data output

2.4 Timing Diagram

The following figure shows the SLVS-EC IP timing diagram.

Figure 9 • SLVS-EC IP Timing Diagram

SLVS-EC IP output is placed from LSB to MSB, and the most recent data is in MSB.

2.5 Resource Utilization

The following table shows the resource utilization of a sample SLVS-EC Receiver Core implemented in a PolarFire FPGA (MPF300TS-1FCG1152I package), for RAW 8 and four lanes and 1920 horizontal resolution configuration.

Table 5 • Resource Utilization

Element	Usage
DFFs	3001
4-input LUTs	1826
LSRAMs	16
