4-1 Antenna Placement 天線擺放

For a Bluetooth wireless product, the antenna placement affects the whole system performance. The antenna requires free space to radiate the RF signals and it cannot be surrounded by the ground plane. Figure 4-1 illustrates a typical example of good and poor antenna placement of the FusionAir-MRT module on the main application board with the ground plane.

Figure 4-1

4-2 Host PCB Mounting Suggestion 主機 PCB 安裝建議

The area under the antenna must not contain any top, inner, or bottom copper layer while designing the host PCB. A low-impedance ground plane ensures the best radio performance (best range, low noise). The ground plane can be extended beyond the minimum recommended as required for the host PCB EMC noise reduction. For best range performance, keep all external metal away from the ceramic chip antenna by a minimum of 30 mm.
