

The *Root Warrior* is easy-to-use.

How it Works

When you use our *Root Warrior* technology, you are introducing an aeration chamber inside the container to improve oxygen flow for better root development. In short, you are helping your plant roots to breathe much better.

1. *Root Warrior* and Container size

The *Root Warrior* comes in three sizes: small (4.0"), medium (6.0"), and large (8.0"). Use a container that is at least twice the height of the *Root Warrior*.

2. The Problems Solved

The *Root Warrior* gets oxygen to the plant roots without expensive potting soils; it prevents over watering; and it prevents the formation of bacteria.

3. *Root Warrior* Compatibility

The *Root Warrior* is compatible with most materials: Ceramic, Concrete, Wooden Containers, Metal, Plastic, Terracotta Pots, and Fabric Bags.

4. Insert the *Root Warrior*

To begin planting, simply place the *Root Warrior* in your container, centered over the drain holes.

5. Add Soil

Cover the *Root Warrior* with 2" to 3" of soil. A good soil recipe is 2/3's garden soil and 1/3 potting soil. Garden soils are nutrient-rich and save you money.

6. Plant and Water Normally

The *Root Warrior* manages air and water balance, so water frequently, especially on hot days. There is little danger of over-watering.
