Overview

This document focuses on the use of the radar, the issues that need to be addressed at each stage to minimise design costs and increase product stability and improve the efficiency of project completion.

From hardware circuit reference design, radar antenna and housing layout requirements, how to differentiate between interference and multi-functional standard UART protocol outputs.

The radar is a self-contained space sensing sensor, consisting of RF antenna, radar chip and high speed main frequency MCU together with a module that relies on a stable and flexible superior algorithm architecture core to solve the user's various scenario detection needs, which can be equipped with a host computer or host computer to flexibly output detection status and data, meeting several groups of GPIOs for custom development.

1. Principle of operation

The radar transmits a millimetre wave signal in the 24G band, the measured target reflects the electromagnetic wave signal and demodulates the transmitted signal, which is then amplified, filtered and processed by ADC to obtain the echo demodulated signal data. The amplitude, frequency and phase of the echo signal are decoded in the MCU unit, which ultimately

enables the measurement of target parameters (breathing, movement, micro-motion, etc.) and scene evaluation.

2. Hardware Design Considerations

The radar needs to have a rated supply voltage of 4.9 – 6V and a rated current requirement of 200mA or more input under normal operating conditions. The power supply must be designed for a supply ripple of $\leq 100\text{mv}$.

2.1 The power supply can be designed with the following circuit in mind

Fig. 1

Fig. 2

2.2 using the wiring diagram

Fig. 3 Schematic diagram of the radar module and peripheral connections

3. Antenna and housing layout requirements

PCBA: the radar needs to be kept $\geq 1\text{mm}$ higher than the other components

Housing construction: need to maintain a distance of 2 – 5mm between the radar antenna face and the housing face

Housing detection surface: non-metallic housing, needs to be flat and straight to avoid curved surfaces which can affect the performance of the entire swept surface area.

Fig. 4 Schematic diagram of the radar module and peripheral connections

4. Static Protection

Radar products have electrostatic sensitive circuitry and are susceptible to electrostatic hazards, therefore they need to be adequately protected from static electricity during transport, storage, work and handling. When handling radar sensors, please wear anti-static gloves if possible.

5. Functional disturbances

5.1 Unoccupied state, abnormal output occupied

In normal conditions, the radar will accurately determine the presence of a sitting or sleeping body and output information on falls, breathing, vital signs etc.

A. Radar scanning area is large, doorway, boarded wall next door movement is detected

Adjustment method: reduce radar sensitivity, radar provides scene setting

B. Radar underneath is facing a running air conditioner or fan

Adjustment: adjust the radar position so that it is not directly in front of the air conditioner or fan

C. Shifting objects caused by air conditioning winds

Adjustment method: cotton, non-metallic objects will not cause false alarms, metal objects need to be fixed

D. The radar is not fixed, vibration causes false alarms

Avoid supporting shaking and vibration

E. Occasional moving objects such as pets, birds, etc.

As the radar measures micro-movements, the sensitivity is very high and this interference cannot be excluded

F. Power supply interference, resulting in occasional false alarms

Try to keep the power supply current stable and reduce ripple

5.2 Manned status, abnormal output unoccupied

Radar determines the presence of a human body by sending and receiving electromagnetic waves. The closer you are to the radar, the more accurate it is.

A. Human body out of radar range

Radar scanning range with adjustment of mounting angle. Radar measurement range, in different environments with different electromagnetic wave reflection areas, the scanning area will vary slightly.

B. False output due to metal occlusion

Excessively thick desks and chairs, metal seats. It will block the electromagnetic wave penetration and cause misinterpretation.

C. Differences in scanning angles

The radar does not scan the torso area. This can lead to false positives.

D. Radar sensitivity is too low

The radar offers parameter adjustment to increase sensitivity for improvement.

6. Functions in detail

6.1 Function point descriptions

Functions	Status change time/function explanation
DP1: occupied/unoccupied	No one to occupied, report within 0.5s Manned to unoccupied, no status output in 1–2 minutes or so
DP2: Some people are stationary / Some people are active	Static dynamic switching, reporting within 0.5 seconds
DP3: Someone close to the device / someone moving away from the device / someone moving without direction	Status output once every 2 seconds

Functions	Status change time/function explanation
DP4: Body movement amplitude parameter 0 – 100	Data output once every 5 seconds Reference (description of output of body motion amplitude parameters)
DP5: Sensitivity setting 1 – 10 steps	Default scene mode, adapted to 10 positions of adjustment
DP6: Scene modes (bed, bathroom, hotel, bedroom, office, default mode)	Adapted to different scenarios according to the size of the area
DP7: No false alarm confirmation prompt	
DP8: Sleep parameter switch	Off by default, sleep function only works when on
DP9: Bed entry/exit	Output status in 3S clock
DP10: Number of bed entries/exits	Count the number of times you enter/leave bed in a day
DP11: Stationary dwell alarms	Outputs in three states, once every 10 minutes
DP12: Length of Sobriety	
DP13: Length of light sleep	
DP14: Length of deep sleep	
DP15: Breathing rate	Normal number of breaths can be tested
DP16: Breathing rate detection signal	If there are factors such as distance, range and other effects, output breath-holding abnormalities, good signals, abnormal movements, abnormal states of shortness of breath
DP17: Sleep scoring (optional, users can rate according to their own way)	Combined day's sleep rating

6.2 Description of the output of the body motion amplitude parameter

Body movement amplitude parameters		
0%	None	Environmental unmanned
1%	Stationary (sleep)	Only breathing without body movement
2% – 30%	Micro–Movements	Only minor head or limb movements Movement
31% – 60%	Walking/fast body movements	Slower body movements
61% – 100%	Running/close range big moves	Rapid body movement

7. Description of the agreement

This protocol is used to communicate between a 24G millimetre wave sleep detection radar and a host computer.

This protocol outlines the radar workflow, provides a brief introduction to the interface protocol component architecture and gives the control commands and data required for the operation of the relevant radar, with the serial communication defined as follows.

Interface level: TTL

Baud rate: 9600bps

Stop bits: 1

Data bits: 8

Parity: None

8. Communication commands and parameter definitions

8.1 Definition and description of the frame structure

A. Frame structure definition

Starting Code	Length of data		Function codes	Address code 1	Address code 2	Data	Check Code	
0X55	Lenth_L	Lenth_H	Command	Address_1	Address_2	Data	Crc16_L	Crc16_H
1 Byte	1 Byte	1 Byte	1 Byte	1 Byte	1 Byte	n Byte	1 Byte	1 Byte
Starting Code	Length of data		Function codes	Address code 1	Address code 2	Data	Check Code	

B. Description of the frame structure

a. Start code: 1 Byte, fixed to 0X55.

b. Data length: 2 Byte, low byte before, high byte after.

Length = Data Length + Function Code + Address Code 1 + Address Code 2
+ Data + Checksum.

c. Function code: 1 Byte

Read command: 0X01

Write command: 0X02

Passive report command: 0X03

Active report command: 0X04

d. Address code: Address code 1

indicates the function classification, address code 2 indicates the specific function.

See the description of address assignment and data information.

e. Data: n Byte

f. Checksum: 2 Byte, low byte before, high byte after.

CRC16 checksum is used, see Appendix 1 for reference code.

8.2 Description of address assignment and data information

24G Bio-aware radar interface content					
	Function Code	Address code 1	Address code 2	Data	Notes
1	Read command 0x01	Marking search 0x01	Device ID 0X01

5				Light sleep 0x01	
6				Deep sleep 0x02	
7				None 0x03	Sleep switch off shows none
8		Duration parameter 0x04	Duration of wakefulness 0x01	4Byte integer data	Unit min
			Length of light sleep 0x02	4Byte integer data	
			Length of deep sleep 0x03	4Byte integer data	

24G Bio-aware radar interface content					
9		Sleep quality parameter 0x05	Sleep quality score 0x01	1Byte integer data	
		Heart rate parameter 0x06	Heart rate value 0x01	1Byte integer data	Unit times/min

Description.

1. The read/write command is for the upper computer to send commands to the radar.
- 2) The report command is for the radar to send information to the upper computer.
- 3) Fall sensitivity is 1~10, default is 4, the higher the level, the more sensitive it is
- 4) Human body sensitivity is 1~10 steps, default 7 steps, the higher the step, the more sensitive it is
